VIRTUAL TABLE WORD BUBBLE

Poll Results

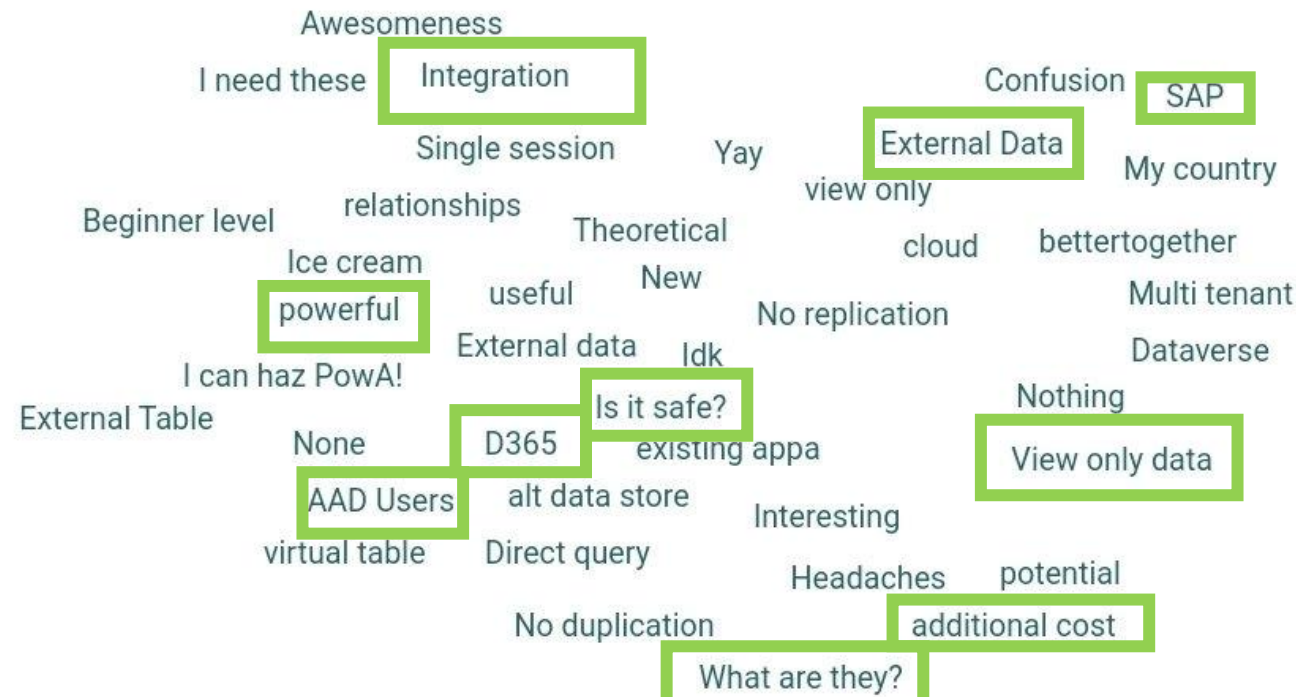

42 Answers

A word bubble visualization showing the frequency of various terms related to Virtual Tables. The bubbles are arranged in a circular pattern, with larger bubbles indicating higher frequency. The terms include:

- Awesomeness
- I need these
- Integration
- Single session
- Yay
- Confusion
- SAP
- External Data
- My country
- view only
- relationships
- Beginner level
- Theoretical
- cloud
- bettertogether
- Ice cream
- powerful
- useful
- New
- No replication
- Multi tenant
- External data
- Idk
- Dataverse
- I can haz PowA!
- Is it safe?
- Nothing
- External Table
- None
- D365
- existing appa
- View only data
- AAD Users
- alt data store
- Interesting
- virtual table
- Direct query
- Headaches
- potential
- No duplication
- additional cost
- What are they?

STORYTIME

How did I end up with Virtual tables?

●

Replacing a legacy app – The data

The application we wanted to replace, had a DBF data backend
250+ tables, no known schema or relationships, no documentation

Replacing a legacy app – The export

Only software to read the data I could get, was the DBF View with export to csv option
Manually exported, hand picked over 50 tables to CSV (it was either that or learn Python)

Replacing a legacy app – The solution

SQL Database

PowerApps

Connected with Virtual Tables

Dataverse

Connected to SQL using Virtual Tables

WHAT ARE VIRTUAL TABLES?

And why should I use them?

What are they?

- Your Virtual Table reads your data from your data source and is able to display it in Dataverse.
- Virtual connectors and tables in Dataverse
- **Re-use data**, without needing to migrate
 - Use them through Dataverse in your app, Power Pages or others.
- Through this connection you can automate without excessive costs for migrations.
- **Full CRUD** (Create, Read, Update, Delete) to your data source.

Table ▾	Name ▾	Type ▾	Managed ▾	Customizable ▾	Tags ▾
Entity Catalog for SQL	msdyn_ec_ [redacted]	Virtual	No	Yes	Custom
Werkr [redacted]	cr3ae_werk [redacted]	Virtual	No	Yes	Custom
Custom Entity [dbo].[Werk [redacted]	cr3ae_dbo_werk [redacted]	Virtual	No	Yes	Custom

Considerations

Architecture

Model driven apps and **Power Pages** can only use Dataverse as a data source.

Can we add new components to the apps that are compatible?

Auditing

Auditing can only take place on the source, **not** on the Virtual Table itself, does this fit the requirements?

Data Migration

Does the client have budget and desire to move the data?

You can **reuse** data.

Prevent high costs.

Premium license needed.

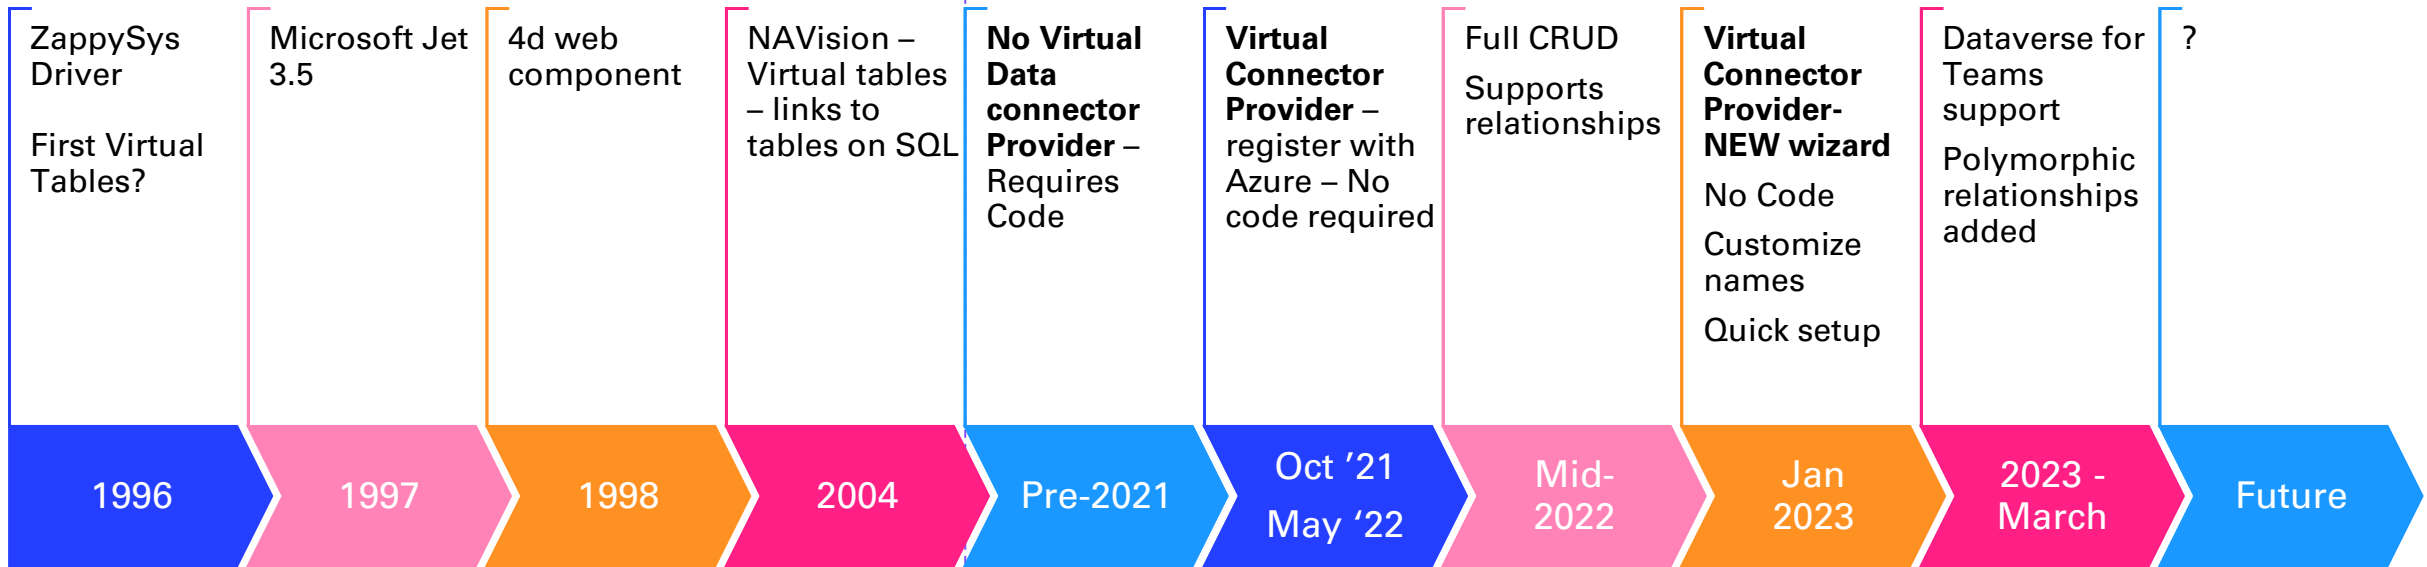

Functionality

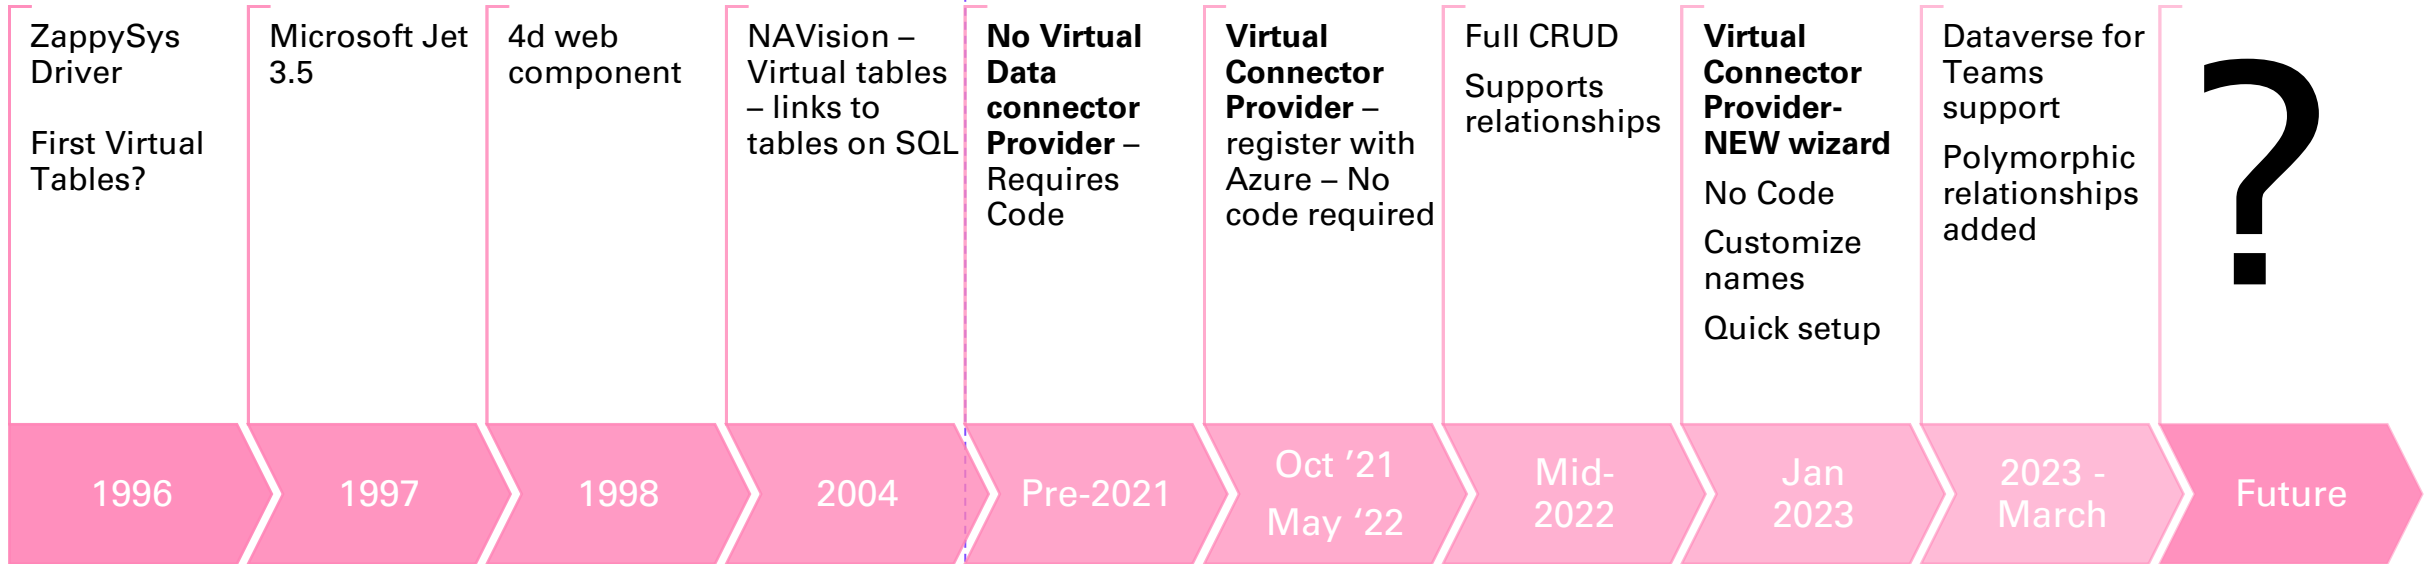

Does the solution fit within the constraints of Virtual Tables?

Is your source SQL and do you want dropdown menus?

Future

Virtual Tables on Model Driven apps & Power Pages!

Currently you can add an existing virtual table to Power Pages, however....

New announcements! Hot of the presses!

- **Create** a Virtual Table straight from Power Pages with SQL and Sharepoint (lists)!
 - You can do this through the newly added - connect to an external table data option.
- **Filter** on virtual or regular on the add table interface
- The **icon** has also changed to differentiate between the types of tables, Virtual vs Dataverse

DIFFERENT TYPES

Virtual Table Providers

	Virtual Connector Providers	OData Data Providers	Custom Data Providers
Code required	No Code	Pro	Pro
Data sources supported	Excel, SharePoint, SQL	OData web services; such as D365 or Azure	Custom plugins to call APIs
Easy to setup/Supportability	Easy	Medium	Difficult

FUNCTIONALITY

WHAT CAN IT DO?

- Connect to your data source that's not natively on Dataverse
- Full CRUD operations for custom virtual tables (if the source let's you)
- Relationships setup on native and virtual tables
- Multi-Table (Polymorphic) Lookups supporting virtual tables

Meaning, you can create lookup tables from and to your virtual table.

Update Data Provider

Data Provider Name: SQLSERVER

Solution: MainSolution

Data Source Entity: adc_ Accommodation /

Assembly: (Assembly) Xrm.Plugins

Main Operation Event Handlers

Retrieve	(Plugin) Xrm.Plugins.RetrievePlugin
RetrieveMultiple	(Plugin) Xrm.Plugins.RetrieveMultiplePlug
Create	(Plugin) Xrm.Plugins.CreatePlugin
Update	(Plugin) Xrm.Plugins.UpdatePlugin
Delete	(Plugin) Xrm.Plugins.DeletePlugin

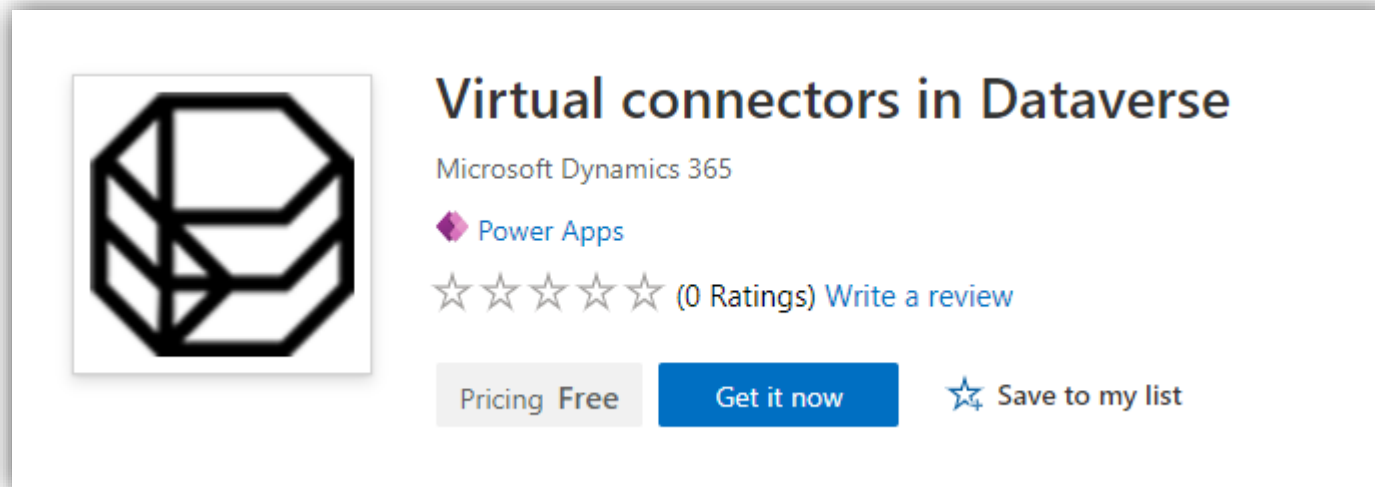

NOTE: All entities using this data provider are read-only.

Update Cancel

More on Plug-ins later

INSTALLING VIRTUAL CONNECTORS IN DATAVERSE

1. Make sure you have Premium
(without it, you won't be able to use Dataverse or virtual tables)
2. Go to AppSource
3. Search for Virtual Connectors in Dataverse
4. Install in your desired environment
5. You're now ready to use virtual tables.

CLASSIC WAY TO CONNECT

VIRTUAL ENTITY CATALOGUE

1. Create an entity catalog through the admin center (classic D365 experience)
2. Through that catalog, select the virtual table you want
3. Edit
4. Click on Edit Row using form
5. Wait for it to load
6. Create or Refresh Entity – Yes
7. Set the Primary key (make sure it's GUID)
8. Set the Primary Field
9. Save the form
10. It will be given the name Custom Entity and have DBO in the schema name by default.
11. The rest of the functionality is the same

Tables > Entity Catalog for [redacted] SQL

Table properties

Name	Primary column	Description
Entity Catalog for [redacted] SQL	Virtual Entity Name	Generated Entity Catalog
Type	Last modified	
Virtual	9 months ago	

Entity Catalog for [redacted] SQL columns and data

Want another data source? Currently we support SharePoint and SQL Server. However, there is a workaround for other data sources. [Details here.](#)

Select a connection

Choose a connection to create a new table from external data.

 SharePoint

 SQL Server

[Advanced options](#) ^

☐ Manually configure connection reference

GOVERNANCE AND COLUMN LEVEL SECURITY

Virtual tables are organizational level tables.
It will display whatever your account authorized to it has access to.

✓ Security at the source, and through security roles on Dataverse.

✗ No Field Level, or Column level security is possible/supported currently.

✓ **Custom lookup fields with polymorphic lookups**

It is possible to create custom security through polymorphic lookups and plugins.

Check out this article by Dynamics Ninja that explains how:

[Virtual Tables - Custom Ownership - Dynamics Ninja](#)

**Quick tip for the Security role in Dataverse;
Make sure to add rights to the Connection table.**

Edit column

Previously called fields. [Learn more](#)

✗ Field level security is not supported for virtual entity.

DIFFERENT NATIVE DATA SOURCES

Excel

Let's start with the elephant in the room - Excel

WHY IS IT SUCH A BAD IDEA?

- Data **needs** to be in tables
- Macros **not** supported
- Formulas **not** supported
- Excel is currently **not** supported in the table driven Virtual Table experience
- Excel files **must be stored on a OneDrive** to participate in a Virtual Table connection
- **The workbook cannot be in use** when using it for Power Apps or Power Automate

DIFFERENT NATIVE DATA SOURCES

SharePoint

LIMITATIONS

- You currently can't select an All view for SharePoint columns on a virtual table. This is a known issue. (It is known)
- The following column types can't be included in a virtual table at this time:
 - Person
 - Image
 - Managed metadata
 - Location: coordinates
 - Attachment
- SharePoint specific columns that will be shown in the virtual table:
 - Compliance Asset ID is an internal column from SharePoint for tracking purposes. It can be ignored.
 - ID is the external primary key from SharePoint. It's read-only and can be ignored.

- Choice fields supported for SharePoint!
- Attachments can be uploaded to the virtual table connection

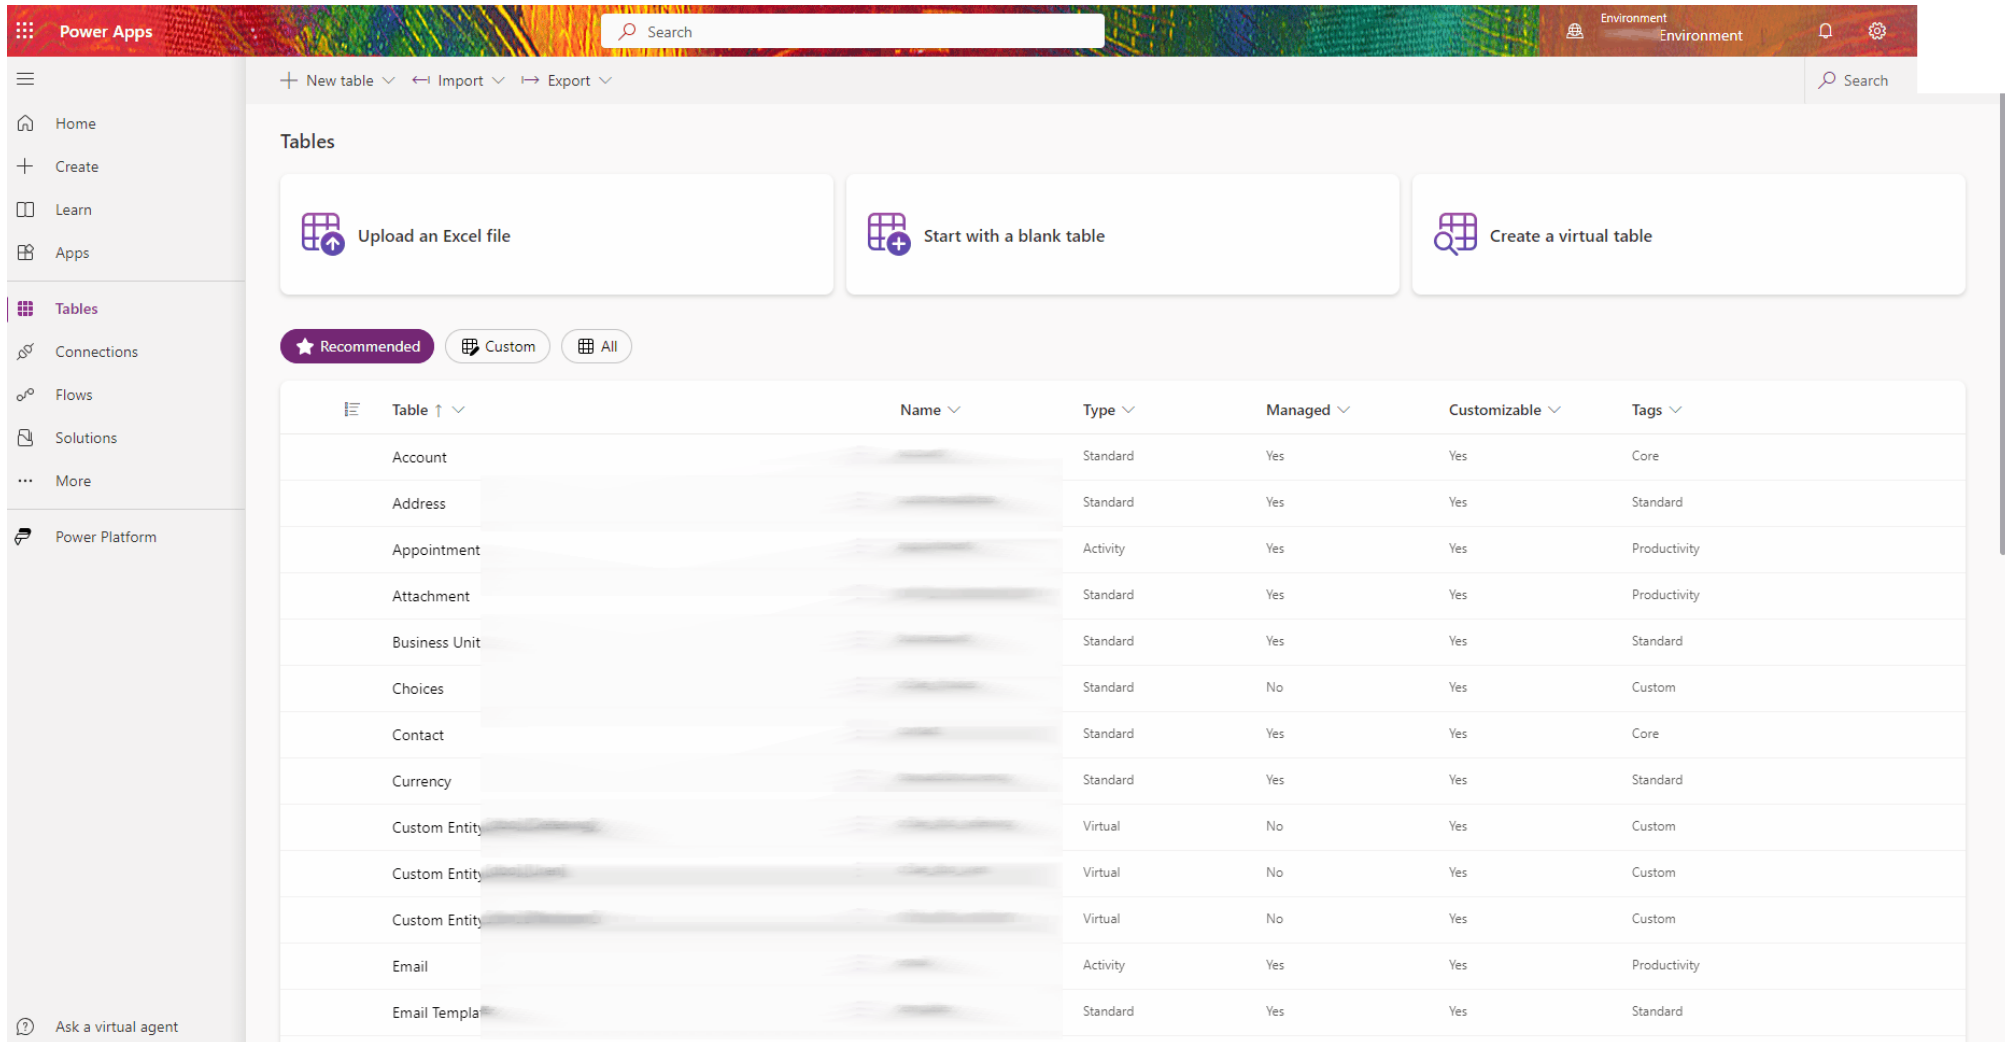

DIFFERENT NATIVE DATA SOURCES

SQL

CONNECTING TO SQL

Pro tip!
toggle/checkbox/Boolean
Convert your SQL column to BIT
BIT is an integer with 0 and 1

The screenshot shows the 'Tables' section of the Power Apps interface. At the top, there are buttons for 'New table', 'Import', and 'Export'. Below these are three main options: 'Upload an Excel file', 'Start with a blank table', and 'Create a virtual table'. A filter bar shows 'Recommended' (selected), 'Custom', and 'All'. The table below lists various tables with their properties.

Table	Name	Type	Managed	Customizable	Tags
Account		Standard	Yes	Yes	Core
Address		Standard	Yes	Yes	Standard
Appointment		Activity	Yes	Yes	Productivity
Attachment		Standard	Yes	Yes	Productivity
Business Unit		Standard	Yes	Yes	Standard
Choices		Standard	No	Yes	Custom
Contact		Standard	Yes	Yes	Core
Currency		Standard	Yes	Yes	Standard
Custom Entity		Virtual	No	Yes	Custom
Custom Entity		Virtual	No	Yes	Custom
Custom Entity		Virtual	No	Yes	Custom
Email		Activity	Yes	Yes	Productivity
Email Template		Standard	Yes	Yes	Standard

VIRTUAL STORED PROCEDURE

Through the Dataverse Accelerator App

Dataverse uses the plugin capability to call stored procedures.

- You can specify how you want to fill it through the wizard.
- Input what is needed, in the plugin it will allow you to say:
field a is input 1
field b is input 2
- Make it execute on a button as an onclick event
- Run and push it the output only to a SQL table
- Access a Virtual Table to access the SQL Table

No delegation issues

That is an issue through when you try through Power Automate.
Also, it's much faster and much more responsive.

Output stays in SQL right now but this could be valuable to your client process.

VIRTUAL TABLES WITH AAD TABLE?

AAD User (Azure Active Directory/Entra ID) is different from the **User table** in Dataverse.

No manager lookups, possible future feature

No groups, only users can be looked up

Dataverse User table
AAD User table

Only displays users with a Dataverse license.
Will show anyone in the AAD User address book.

☐ Virtual table that connects to ALL users as **read-only**.

☐ This table is NOT available through Power Automate. (It leverages Graph)

☒ Include the AAD User table in multi-table lookups (polymorphic lookups)

[aaduser table/entity reference \(Microsoft Dataverse\) - Power Apps | Microsoft Learn](#)

LEVERAGING THE POWER PLATFORM

Model Driven Apps

Works with Dataverse

Any other data source needs to be connected through a virtual table.

Works with Dataverse

Any other data source needs to be connected through a virtual table.

Power Pages

Canvas Apps

- ☒ Works with all data connectors!
- ☐ Save data locally in the table.
- ☐ Patch to the virtual table with custom fields.
- ☒ Display data through lookup fields

☒ Dataverse trigger - 'When a row is added, modified or deleted' doesn't work with Virtual Tables.

☒ Use a trigger on your data source!
For example, when a SQL item has been modified.

☒ Dataverse trigger - 'When a row is added, modified or deleted' is supported for Virtual Tables with Dataverse Events (More on that later)

+

Power Automate

Power Virtual Agent

You can call information from Dataverse, both normal and virtual tables.

Connect using Power Automate in an action to create new rows, update rows, list rows etc. for a Virtual Table.

REPORTING

Virtual Table - Reporting

Only available in PowerBI through the Common Data Service (Legacy) connector

Don't use the Dataverse connector. It won't display the virtual tables.

You can also connect directly to the source as well.

[Power Query Common Data Service \(Legacy\) connector](#)

Get Data

https://[redacted].crm.dynamics.com/ [2]

Entities [303]

- ☐ aaduser
- ☐ Account
- ☐ activityfileattachment
- ☐ ActivityMimeAttachment
- ☐ ActivityParty
- ☐ ActivityPointer
- ☐ Annotation
- ☐ appaction
- ☐ appaction_appactionrule_classicrules

KNOWN LIMITATIONS ON ALL VIRTUAL TABLES + POSSIBLE WORKAROUNDS

Positive points

- View data from multiple tables as a single table
- Perform complex queries
- View of data that is customized for a specific user or group
- Access data from external sources
- No need to migrate data
- Cost saving – no double data storage needed like with Dataflows
- Easy setup, no custom coding needed
- You're able to leverage them throughout the entire Power Platform
- Supported by Dataverse for Teams

Limitations

1. No dropdown/choice columns on SQL data backend
2. No Field Level Security possible (Security at the source)
3. Business Process Flows are not supported
4. Files and attachments are not supported
5. Virtual table queries are limited to return 1000 records per query
6. Max character length for text is 4000 characters
7. No activity type tables (feedback)

- Rollup and calculation fields not supported
- Audit logs - No Dataverse auditing possible on a virtual table
- Values inside Primary Column need to be GUID (non string)
- The primary key needs to be correct or the data (SQL or Excel) won't display
- Cannot set view on primary key column – descending
- Dataverse can only create columns that include datatypes that are compatible
- Existing tables cannot be converted
- Virtual tables don't allow joined connections
- SharePoint will use the hidden numeric ID field present in all lists

PCF COMPONENTS

Trick your virtual entity connection into allowing dropdowns, or other unsupported ISV/data actions.

For example: A dropdown/choice doesn't exist into SQL.
Make it look like one, but have the data be outputted as text.

What is a PCF component?

It's a piece of code, wrapped around your control, to make it behave differently, but still have the same result for your data source.

You can re-use these components throughout your solution.

- After importing your component
- Double click on your control in your form
- Add to your form control (if desired, hide the default controls)

[CSV Dropdown Control | PCF Gallery](#)

Pro tip – Make sure you also import your PCF component in your destination environment if you do ALM

SHORT INTERMISSION

Taking a breather

TECHNICAL DEEP DIVE

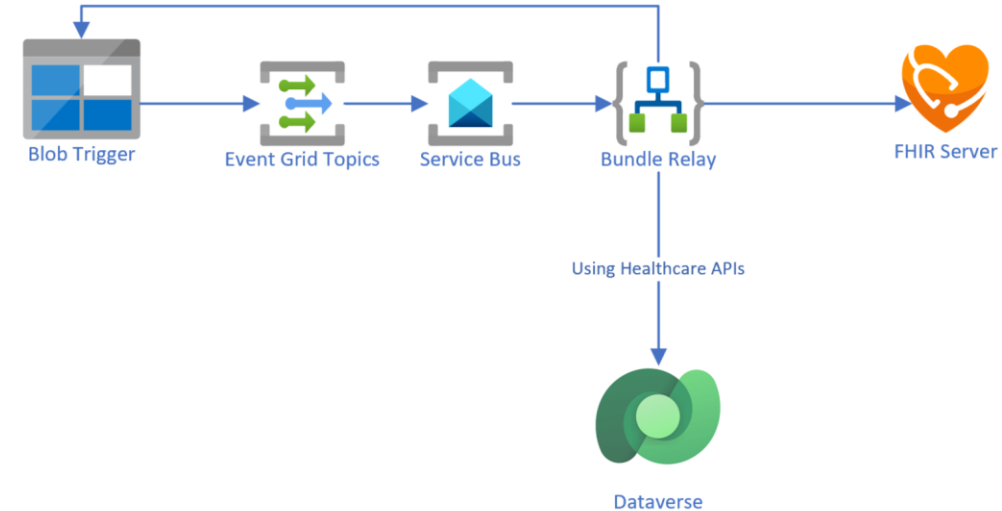

DATAVERSE EVENTS

Respond to Dataverse Events with Virtual Tables

What is a Dataverse Event?

- Power Automate Flows
- Azure Service Bus
- Azure Event Hub
- Webhooks
- Dataverse plug-ins

Participate in asynchronous Dataverse Event Framework pipeline events.

Most importantly, you can leverage the Dataverse 'when a row is added modified or deleted' trigger.

⁺DIFFERENT ° DATA SOURCES

All 1000+ Data connectors?

Virtual Table Providers

	Virtual Connector Providers	OData Data Providers	Custom Data Providers
Code required	No Code	Pro	Pro
Data sources supported	Excel, SharePoint, SQL	OData web services; such as D365 or Azure	Custom plugins to call APIs
Easy to setup/Supportability	Easy	Medium	Difficult

OData Data Providers

MANY CONNECTORS
SUPPORT API ACTIONS
(FOR CRUD)

**IT MUST HAVE A GUID
VALUE** THAT DATAVERSE
CAN USE AS A PRIMARY
KEY TO WORK

YOU **CAN'T** USE IT TO
CONNECT TO ANOTHER
ENVIRONMENT

[USE THE VIRTUAL TABLE
ODATA V4 DATA
PROVIDER WITH
MICROSOFT DATAVERSE -
POWER APPS |
MICROSOFT LEARN](#)

CONNECT TO MANY
OTHER DATA SOURCES

Remember those 1000+ connectors?

Leverage the Microsoft Dataverse Data SDK to query against your Virtual Table, using code to get data.

Create custom virtual data providers. ODataV4 interface supports CRUD

Requirements:

- C# code
- API knowledge
- Visual Studio Code
- Microsoft.CrmSdk.Data package
- Install NuGet packages
- Relevant API accounts, access tokens and such

You can leverage this in ISV's, third party apps and more.

Be mindful of the limitations, and whether your backend can handle such queries/code.

<https://learn.microsoft.com/en-us/power-apps/developer/data-platform/virtual-entities/sample-ve-provider-crud-operations/>

CUSTOM VIRTUAL DATA PROVIDER

With CRUD

Virtual Table Providers

	Virtual Connector Providers	OData Data Providers	Custom Data Providers
Code required	No Code	Pro	Pro
Data sources supported	Excel, SharePoint, SQL	OData web services; such as D365 or Azure	Custom plugins to call APIs
Easy to setup/Supportability	Easy	Medium	Difficult

Virtual Tables – CRUD Plugin 1/3

Implementing CRUD plug-ins and registering the assembly

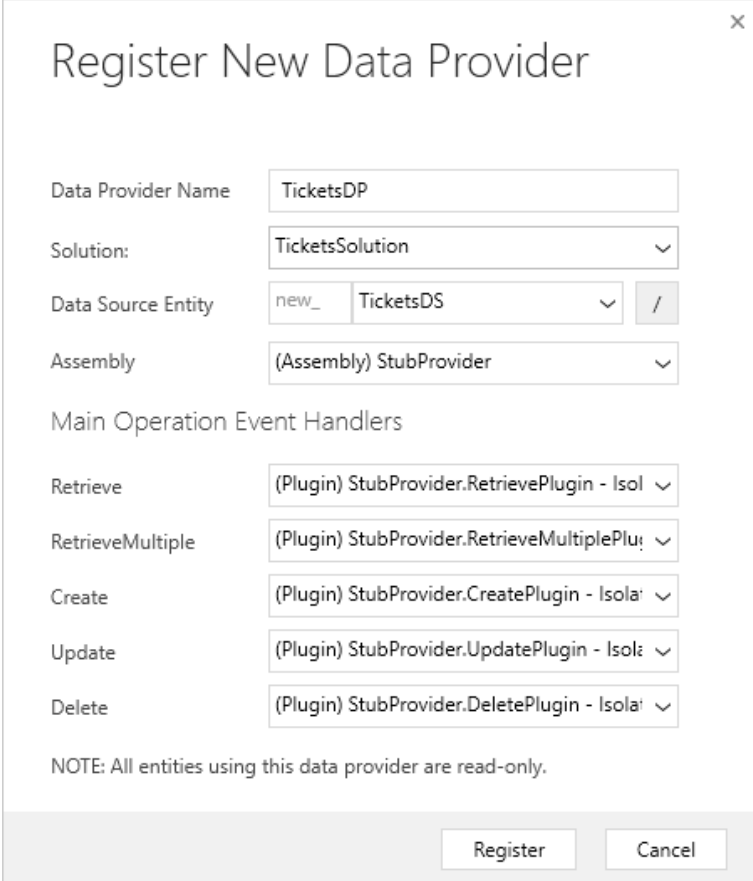

- 1. Create a plugin project, and install the NuGet packages
- 2. Add the 6 class files to your solution, in each use specific statements
- 3. Create the code for all these 6 classes
- 4. Compile and build the solution
- 5. Register the assembly using the plugin registration tool (NuGet)
- 6. Create a new connection to your data verse environment
- 7. Select the assembly file and register the plugin
- 8. Make sure to select all plugins for Create, Update, Delete etc.

Class file name	Purpose
Connection.cs	This class contains code for creating and managing connection to the external SQL data source. It includes connection string parameters specific to the external database and SQL-based authentication information required to establish the connection. Replace the values respective to your: Database server, UserID, Password, and table name that you will be creating a virtual table in Dataverse.
CreatePlugin.cs	This class contains code that handles the create operation for the virtual table.
UpdatePlugin.cs	This class contains code that handles updating records in the virtual table.
RetrievePlugin.cs	This class contains code that retrieves a specific record from the virtual table.
RetrieveMultiple Plugin.cs	This class contains code for fetching multiple records from the virtual table.
DeletePlugin.cs	This class contains code that allows you to delete a record in the virtual table.

Virtual Tables – CRUD Plugin 2/3

Creating data provider and adding plug-ins to the provider

9. Select the Register drop-down and then select Register New Data Provider.
10. In the Register New Data Provider dialog, enter the following details:
11. Enter Data Provider Name.
12. In the Solutions option, select an existing solution or create a new solution in the drop-down.
13. In the Data Source Table (Entity) option, select Create New Data Source.
Enter the details. Make sure that the data source is part of the solution you created or selected.
14. Map each of the registered plug-in to its respective operations.
15. Register the new data provider.
16. In the Plugin Registration Tool, you'll see the new data source record and the associated data provider. Selecting the data source will display the details which include the plug-ins and their registered GUID.

The image shows a 'Register New Data Provider' dialog box with the following fields and options:

- Data Provider Name:** TicketsDP
- Solution:** TicketsSolution (dropdown)
- Data Source Entity:** new_ TicketsDS (dropdown with a slash icon)
- Assembly:** (Assembly) StubProvider (dropdown)
- Main Operation Event Handlers:**
 - Retrieve:** (Plugin) StubProvider.RetrievePlugin - Isol (dropdown)
 - RetrieveMultiple:** (Plugin) StubProvider.RetrieveMultiplePlu (dropdown)
 - Create:** (Plugin) StubProvider.CreatePlugin - Isola (dropdown)
 - Update:** (Plugin) StubProvider.UpdatePlugin - Isol (dropdown)
 - Delete:** (Plugin) StubProvider.DeletePlugin - Isola (dropdown)
- NOTE:** All entities using this data provider are read-only.
- Buttons:** Register, Cancel

Virtual Tables – CRUD Plugin 3/3

17. Create a new virtual table data source by navigating to Setting > Administration > Virtual Table (Entity) Data Sources.
18. Select New and then select the data provider you created in the previous step from the drop-down.
19. Enter a name for the data source and select Save and Close.
20. You are now ready to create the virtual table that represents the external data source. To do this, go to Settings > Customize the System.
21. In the left navigation pane of solution explorer, Select Tables (Entities), and then select New.
22. Enter the following details on the right side
23. Save and Close
24. In the left navigation pane, select and expand on the virtual table you created.
25. Select Fields to update and create new columns representing the external source.
26. Select the Primary Key column for the virtual table and select Edit.
27. Update the External Name column to match the column name in your external data source. In this example, the external column name is TicketID.

API

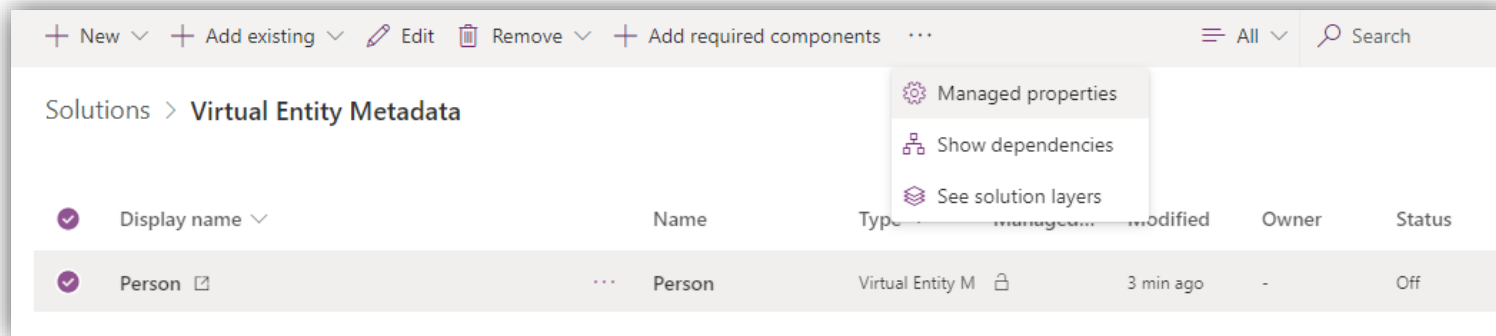

(Application Programming Interface)

Virtual Tables – API-1/4

Leverage a REST API, and use GET, PUT, POST, DELETE and other standard HTTP verbs.

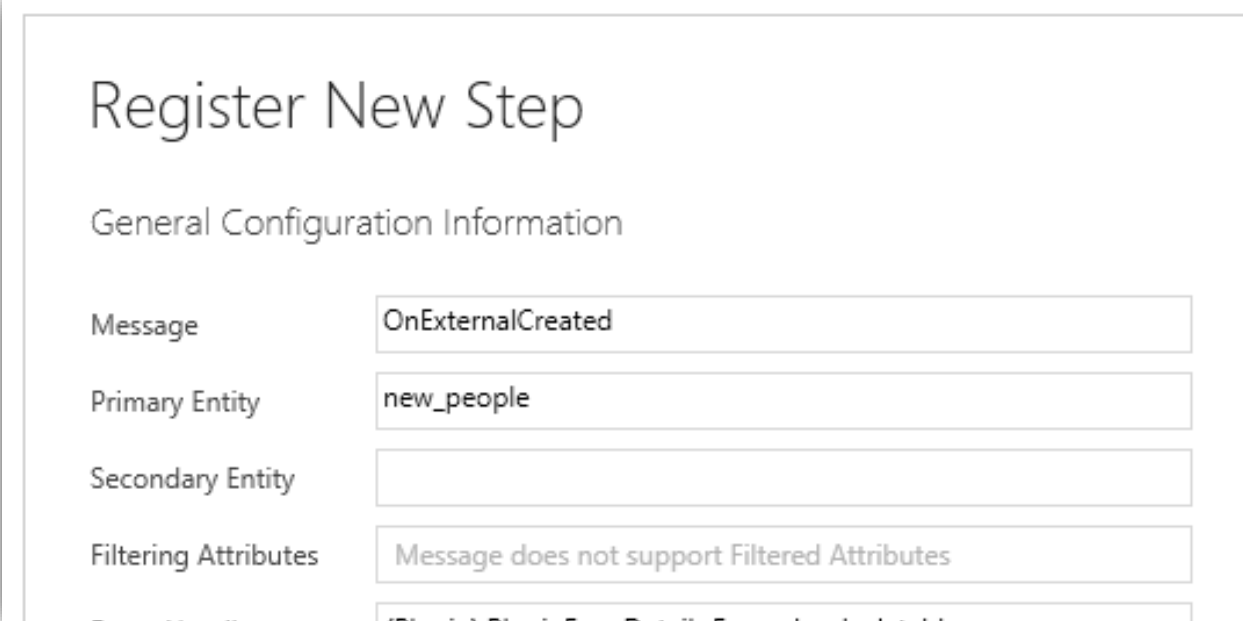

1. Set up Virtual Table Metadata – specify your Extension Entity ID
2. Once set up – go to the following URL:
[Organization Uri]/api/data/v9.2/\$metadata
3. Search for 'OnExternalCreated' and find the definition of your action.

Virtual Tables – API-2/4

Register a plug in

4. Open the Plugin registration tool.
5. Go to your plugins
6. Register a new step

Register New Step

General Configuration Information

Message	OnExternalCreated
Primary Entity	new_people
Secondary Entity	
Filtering Attributes	Message does not support Filtered Attributes
Step Name	PluginStepName

Virtual Tables – API-3/4

Create a bound action

This example is the OnExternalCreated.

7. Include the ID value, and other known properties.
8. Make sure the target parameter is always set to the @odata.type annotation property to define the type of entity.
Without this it wont work.
9. The calls should always return: 204: No Content

XML

```
<Action Name="OnExternalDeleted" IsBound="true">
  <Parameter Name="entityset" Type="Collection(mscrm.new_people)" Nullable="false"/>
  <Parameter Name="Target" Type="mscrm.crmbaseentity" Nullable="false"/>
</Action>
<Action Name="OnExternalUpdated" IsBound="true">
  <Parameter Name="entityset" Type="Collection(mscrm.new_people)" Nullable="false"/>
  <Parameter Name="Target" Type="mscrm.crmbaseentity" Nullable="false"/>
</Action>
```

HTTP

Copy

```
POST [Organization Uri]/api/data/v9.1/new_peoples/Microsoft.Dynamics.CRM.OnExternalCreated HTTP/1.1
Authorization: Bearer [REDACTED]
Content-Type: application/json

{
  "Target": {
    "@odata.type": "Microsoft.Dynamics.CRM.new_people",
    "new_name": "John",
    "new_age": 23,
    "new_lastname": "Doe",
    "new_peopleid": "f6f5896b-bf08-455c-9bd3-526760cb3685"
  }
}
```

Virtual Tables – API-4/4

Results

10. When using the WEB API, get the MetadataId of the Virtual Table

```
HTTP Copy

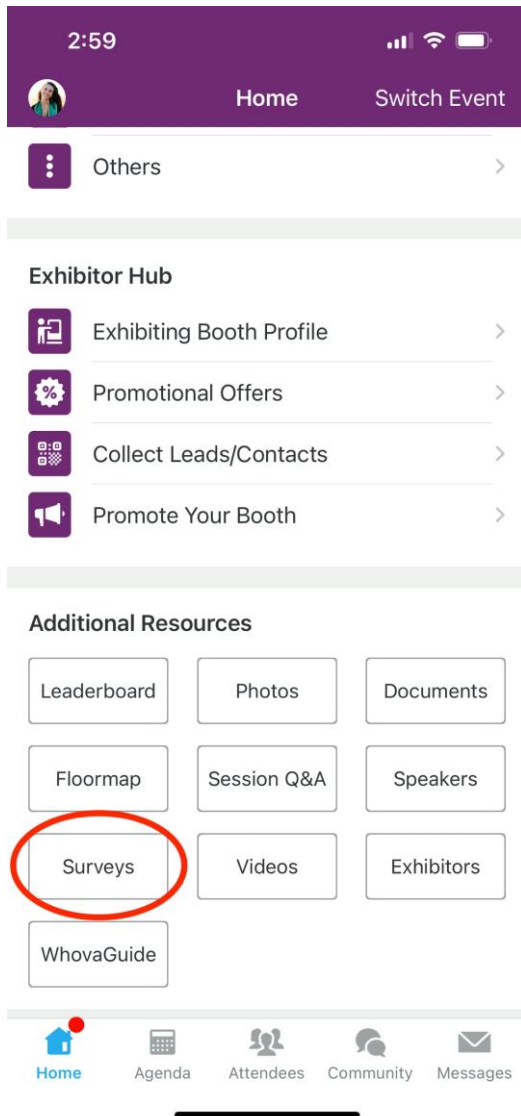

GET [Organization Uri]/api/data/v9.1/EntityDefinitions(LogicalName='new_people')?$select=MetadataId HTTP/1.1
OData-MaxVersion: 4.0
OData-Version: 4.0
Accept: application/json
Authorization: Bearer [REDACTED]

Response:

HTTP Copy

HTTP/1.1 200 OK

{
  "@odata.context": "[Organization Uri]/api/data/v9.1/$metadata#EntityDefinitions(MetadataId)/$entity",
  "MetadataId": "b198e6f3-3dd6-4c0b-9570-702f0c10d577"
}
```

Session Feedback Surveys

We really want to hear from YOU!

In the pursuit of making next year's Microsoft Power Platform Conference even better, we want to hear your feedback about this session.

Here's How -

- *Simply go to the Whova App on your smartphone*
- *Scroll down on the Microsoft Power Platform Conference Homepage to 'Additional Resources' to click "Surveys".*
- *Click Session Feedback.*
- *Scroll down to find this session title.*
- *Complete the session feedback survey.*
- *Finally, click 'Submit'*

It's just that easy!
